Primary lateral sclerosis (PLS)

Information for people with or affected by primary lateral sclerosis

Primary lateral sclerosis (PLS) is a very rare form of motor neurone disease (MND) that progresses slowly. If you have been diagnosed with PLS, your needs may be different to those with other types of MND. This information sheet looks at ways to manage the symptoms and how to access further support.

The content is split into the following sections:

- 1: **What is PLS?**
- 2: **What are the symptoms?**
- 3: **What help can I get?**
- 4: **How do I find out more?**

 This symbol is used to highlight **our other publications**. To find out how to access these, see *Further information* at the end of this sheet.

 This symbol is used to highlight **quotes** from other people with or affected by MND.

The MND Association has been certified as a producer of reliable health and social care information.

www.england.nhs.uk/tis

What do the words mean?

Bulbar:	used to describe symptoms relating to swallowing and speech. The word refers to the bulb-shaped part of the brainstem that contains motor neurones needed for swallowing, speaking and chewing.
Dysarthria:	slurring of speech.
Dysphagia:	difficulties with swallowing. This may be liquids, solids or both.
Electromyogram (EMG):	a test that uses thin needles to measure the activity in the muscles. When muscles start to lose their nerve supply, this can be detected by abnormal electrical activity.
Emotional lability:	also known as pseudo-bulbar affect. It causes laughing or crying, sometimes at inappropriate times. It can be difficult to stop and often does not reflect how you feel.
Magnetic resonance imaging (MRI):	a scan which involves lying inside a large tube-shaped scanner that produces detailed images of the inside of the body. It is used to rule out anything abnormal in the brain and spine that might produce the same symptoms as PLS.
Nerve conduction test:	this test uses small patches placed on the skin to check the speed of electrical signals in the nerves.
Palliative care:	these specialists work to improve the quality of life for people with life-shortening conditions. This can include symptom control and support for any psychological, social, spiritual, religious or other needs.
Urinary urgency:	inability to wait to use the toilet (urinate) when your bladder feels full.

1: What is PLS?

PLS is a very rare form of MND where symptoms progress slowly over many years. It represents 3 in 100 cases of MND. PLS typically affects people aged over 40, and symptoms often begin at a younger age than those with more common types of MND.

As with all types of MND, there is no cure or specific treatment for PLS, but symptoms can be managed to improve your quality of life. With PLS, you are likely to remain independent longer than with other forms of MND.

PLS affects the nerve cells that send messages from the brain down the spinal cord and on to the muscles. This causes stiffness in the muscles and joints (known as 'spasticity'), followed by weakness. This usually begins in the legs, but some people develop weakness and stiffness in the muscles used for speech and swallowing. Not all symptoms always happen to everyone, and they do not usually develop at the same time.

For detailed information about MND, see:

Living with motor neurone disease – our main guide to help you manage the impact of the disease

Living with PLS can lead to many frustrations due to the ongoing impact of the disease on your communication, mobility and independence. Ensuring that your needs are well met can help to reduce this frustration. Equipment, advice and support are available to assist with many aspects of daily living. See section 3: *What help can I get?* for more information.

What causes PLS?

It is not known what causes PLS, and research is ongoing. It is thought that a combination of environmental and genetic factors play a part, but it is not currently possible to give a clear answer about the exact triggers. PLS is not thought to be an inherited condition.

How is PLS diagnosed?

Like all types of MND, there is no single test to diagnose PLS, but an experienced neurologist can identify the possibility based on symptoms and physical examination. They will first rule out other conditions that might cause similar symptoms, such as multiple sclerosis, or something causing damage to the brain or spinal cord. It can take time to be sure that you have PLS and most people will have had symptoms for 3 to 4 years before a definite diagnosis can be made by a neurologist.

If your GP thinks you may have a form of MND or another neurological condition, you will be referred to a neurologist who may arrange the following:

- a full assessment of your symptoms and family medical history
- a physical examination
- scans to check for any problems in the brain and spinal cord
- tests on your nerves and muscles
- blood tests to exclude other causes
- tests on the fluid from around your spine (cerebrospinal fluid or 'CSF'), known as a lumbar puncture.

How will PLS affect my life expectancy?

PLS progresses very slowly, but is disabling. Most people with PLS live for over 10 years from the time symptoms first appear, and many for over 20 years. However, this depends on whether other medical conditions are also present.

Occasionally people thought to have PLS have their diagnosis changed to a different form of MND, such as amyotrophic lateral sclerosis (ALS), as the progression of their symptoms become clearer. ALS is the most common form of MND. It progresses more quickly than PLS and is usually life-shortening.

2: What are the symptoms?

The early symptoms of PLS are very similar to other forms of MND, so it can be difficult to tell them apart at first. Not everyone will experience all of the following symptoms, or in any particular order. You may have additional symptoms that are not listed here, as the disease can affect people differently. You may also have an unrelated problem which needs medical attention, so ask your GP if you have any concerns.

Some of the symptoms you may experience with PLS are:

- problems with balance
- stiffness and weakness of muscles, especially in the legs
- muscle spasms and cramps
- slurring of your speech
- emotional lability
- bladder urgency
- fatigue.

The symptoms may cause you to experience:

- a higher number of trips and falls
- pain in your neck, back, legs and other muscles
- difficulties managing daily tasks such as washing, dressing, cooking etc
- difficulties walking
- problems with speaking clearly.

Can I still drive?

It is a legal requirement for you to inform the DVLA and your insurance company if you have been diagnosed with PLS, as it may eventually affect your ability to drive. However, it may still be possible to drive, so seek advice from your GP, consultant, specialist nurse or MND care co-ordinator.

 For further information about driving and MND, see:
Information sheet 12A – *Driving*

3: What help can I get?

PLS affects everyone differently, but the impact of the disease can be frustrating and restrict your independence. Equipment and therapies can help you stay independent for as long as possible and improve your quality of life.

Ask your GP for a referral to an occupational therapist (OT). They can assess your needs, advise on what equipment may be helpful, and help you continue with daily routines independently for as long as possible.

With PLS you have time to plan for your future needs, but it is worth planning ahead as waiting lists for equipment can cause lengthy delays. Before buying any equipment and aids, get an independent assessment of your needs from an OT. Private purchases can be costly and may not suit your needs or your home. An assessment also enables you to discuss ways of adapting your routines and methods to help you maximise your independence.

Over time you may develop your own solutions and techniques, which can be very effective, but check with your OT for advice on safety.

 For more information on what equipment or aids may be helpful, see:
Information sheet 11C – *Equipment and wheelchairs*

What can be done about stiff, tight muscles or cramps?

Getting plenty of rest may help to ease painful cramps and help you recover better if you are injured after a trip or fall. Talk to your health and social care team for advice.

Your GP, consultant, specialist nurse or MND care co-ordinator may be able to offer medication to relax your muscles and relieve cramps and spasms. If your pain is persistent, you can ask to for a referral to a pain clinic or palliative care team. Physiotherapy can also provide some relief.

 For information about palliative care and physiotherapy with MND see:
Information sheet 3D – *Hospice and palliative care*
Information sheet 6A – *Physiotherapy*

Some people find massage helpful to ease stiff or painful muscles. Get advice from your GP or consultant to ensure this is suitable for you. Massage should be provided by an experienced, registered therapist.

 For more information about massage and other complementary therapies, see:
Information sheet 6B – *Complementary therapies*

What can be done about muscle weakness?

Muscle weakness cannot be reversed by exercise. Gentle regular exercise may:

- assist with flexibility and range of movement in your joints
- help maintain unaffected muscles
- support posture and balance.

Ask your GP or health and social care team for a referral to a relevant physiotherapist, experienced in MND. They can recommend a suitable exercise programme to meet your needs. It is not advised to over-exercise with any form of MND, as this may lead to fatigue.

 For information about physiotherapy with MND see:
Information sheet 6A – *Physiotherapy*

What can be done about my foot dragging?

If you experience ‘foot drop’ where your foot drags, ask your physiotherapist or OT for guidance. This may include a referral to an orthotics department who can provide you with appropriate splints and footwear to help support your foot and ankle.

As PLS progresses, you may need to use walking aids or a wheelchair to get around. Your GP, physiotherapist or OT can refer you to an appropriate service for support and advice.

What can be done about speech difficulties?

PLS may affect the muscles in your tongue, face and throat, making it difficult to speak. Your speech may slur and become unclear.

Ask your GP or wider health and social care team for a referral to a speech and language therapist (SLT) for an assessment. They can advise you about techniques and equipment to help with speech problems.

For more information on speech difficulties with MND, see:
Information sheet 7C – *Speech and communication support*
Information sheet 7D – *Voice banking*

What can be done about swallowing difficulties?

With PLS, swallowing can become more difficult and you may experience occasional coughing. This can lead to a slightly increased risk of inhaling small pieces of food into your lungs (known as 'aspiration'), which can sometimes lead to chest infections. Swallowing difficulties can also lead to weight loss, dehydration and lack of energy.

For more information about swallowing:
Information sheet 7A – *Swallowing difficulties*

Ask your GP or wider health and social care team for a referral to a speech and language therapist (SLT) who can assess your ability to swallow safely. Also ask for a referral to a dietitian, who can provide information about your diet, consistencies of food, drink and supplements to help you maintain a healthy diet.

With PLS, you are likely to be able to maintain your eating and drinking needs without having to top up with tube feeding (for more information, see our guide *Eating and drinking with motor neurone disease*). However, if you do feel this could help, ask for referral to an SLT and a dietitian.

What can be done about drooling?

If your swallowing is affected by PLS, saliva can gather in the mouth and throat and lead to drooling, which may be embarrassing. However, drooling is less common for people with PLS than other forms of MND.

Talk to your health and social care team as various options can be offered. This can include advice on medication to help dry up saliva and suction machines for clearing out the mouth.

For more information about problems with saliva, see:
Information sheet 7A – *Swallowing difficulties*

Will I be affected by emotional lability with PLS?

Emotional lability (also known as pseudo-bulbar affect) is a symptom sometimes seen in MND, where people experience crying or laughing inappropriately. Although it is not experienced by everyone, this symptom is more common in people diagnosed with PLS. The crying or laughing can be difficult to stop and you may feel out of control. This can be distressing for you and those close to you, who may not understand and assume you are depressed.

"It is so difficult to explain that my crying does not mean I am depressed, in fact I more often cry about happy things".

In many cases the symptom eases over time. If the responses are persistent and causing distress, talk to your GP as medication is available that may help. If your GP is not familiar with emotional lability, try to talk to an appropriate member of your health and social care team with experience of neurological conditions.

For more information about emotional lability, see:
Information sheet 9C – *Managing emotions*

"The more people that know this problem is due to my disease, the less of a problem it feels to me."

Will PLS affect the way I think?

You are less likely to be affected by significant changes to thinking and behaviour with PLS than with other forms of MND. For most, the changes are subtle and have little or no effect on daily life or the ability to make decisions.

If you experience changes to the way you think and learn, you may find it becomes more difficult to:

- make and carry out plans
- think about what you need or want to do
- do activities in the right order
- do more than one thing at a time
- process information and solve problems
- consider options and consequences carefully when making decisions
- concentrate and take in new information
- recognise other people's feelings
- finish tasks.

For more details about how MND can affect thinking and behaviour, see:
Information sheet 9A – *Will the way I think be affected?*

For information about supporting someone affected by these changes, see:
Information sheet 9B – *How do I support someone if the way they think is affected?*

What can be done about fatigue?

It might be helpful to take on board the idea that you have a 'bank account' of energy to spend each day. If you overspend on energy one day, you may feel extremely tired the next. Plan to do valued and essential tasks first. Delay or get assistance for other tasks as needed.

Try to:

- listen to your body and pace yourself
- prioritise tasks, manage your time and be flexible with routines
- use equipment to help you do things more easily
- talk to your physiotherapist or occupational therapist about ways to manage your fatigue
- plan a rest day before and after a particularly busy time, such as a family event
- avoid excessive exercise routines.

For more information, see:
Information sheet 11D – *Managing fatigue*

What can be done about bladder urgency?

Some people with PLS experience a strong, sudden urge to urinate (urinary urgency) caused by over-activity of the muscles that control the bladder. Medication may help with this symptom, so ask your GP or neurologist for advice. They can also rule out other causes such as bladder infections.

What can be done about falls?

PLS often affects balance early on and, with additional weakness of the leg muscles, you may be more likely to have falls. This can make day-to-day tasks difficult, and you could injure yourself.

Ask your GP to refer you to an OT who may be able to provide you with equipment and advice to reduce the risk of falls. Your physiotherapist can also advise you and your carer on how to manage falls if they happen.

As PLS progresses, you may need to use walking aids or a wheelchair to get around. Your GP, physiotherapist or OT can refer you to an appropriate service for support and advice.

For more information on wheelchairs, see:
Information sheet 11C – *Equipment and wheelchairs*

How can I contact other people with PLS?

As the PLS form of MND is generally a longer-term condition, you may find it beneficial to share experience and knowledge with others in a similar situation.

An email based support group has been developed for people living with PLS, and another slower progressing form of MND known as PMA.

If you would like to join the group, contact our helpline, MND Connect. See *Further information* in section 4: *How do I find out more?* for contact details.

4: How do I find out more?

Useful organisations

We do not necessarily endorse any of the following organisations, but have included them to help you begin your search for further information.

The contact details are correct at the time of print, but may change between revisions. If you need help to find an organisation or have any questions, contact our MND Connect helpline (see *Further information* at the end of this sheet for details).

GOV.UK

Online government advice on a variety of welfare topics in England and Wales, including support for people with disabilities.

Email: email addresses are provided on the website, related to each enquiry
Website: **www.gov.uk**

Health and Social Care Northern Ireland (NHS Northern Ireland)

Information on NHS services in Northern Ireland. This is an online service only.

Email: through the website contact page
